# Homework 2 - Berkeley STAT 157

Handout 1/29/2019, due 2/5/2019 by 4pm in Git by committing to your repository.

```
In [207]: from mxnet import nd, autograd, gluon
```

## 1. Multinomial Sampling

Implement a sampler from a discrete distribution from scratch, mimicking the function mxnet.ndarray.random.multinomial. Its arguments should be a vector of probabilities p. You can assume that the probabilities are normalized, i.e. that hey sum up to 1. Make the call signature as follows:

```
samples = sampler(probs, shape)

probs : An ndarray vector of size n of nonnegative numbers summing up to 1
shape : A list of dimensions for the output
samples : Samples from probs with shape matching shape
```

#### Hints:

- 1. Use mxnet.ndarray.random.uniform to get a sample from U[0,1].
- 2. You can simplify things for probs by computing the cumulative sum over probs.

```
In [208]: def sampler(probs, shape):
               ## Add your codes here
               for i in range(1, len(probs)):
                   probs[i] += probs[i-1]
               tmp = nd.random.uniform(0, 1, shape)
               result = nd.zeros(shape)
               for i in range(len(probs)):
                   result += 1.0 * (tmp > probs[i])
               return result
          # a simple test
          sampler(nd.array([0.1, 0.2, 0.3, 0.2, 0.05, 0.15]), (9,20))
Out[208]: [[0. 5. 2. 2. 1. 3. 4. 3. 0. 2. 5. 1. 2. 2. 2. 2. 0. 2. 1. 4.]
           [2. 2. 5. 3. 0. 3. 5. 0. 5. 0. 2. 0. 2. 0. 1. 1. 3. 4. 0. 2.]

          <NDArray 9x20 @cpu(0)>
```

# 2. Central Limit Theorem

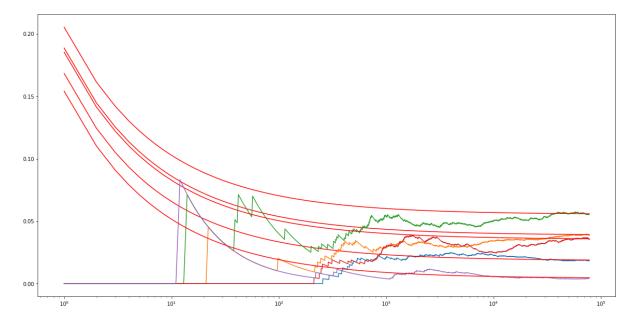

Let's explore the Central Limit Theorem when applied to text processing.

- Download <a href="https://www.gutenberg.org/ebooks/84">https://www.gutenberg.org/files/84/84-0.txt</a>) from Project Gutenberg
- Remove punctuation, uppercase / lowercase, and split the text up into individual tokens (words).
- For the words a, and, the, i, is compute their respective counts as the book progresses, i.e.

$$n_{\text{the}}[i] = \sum_{j=1}^{i} \{w_j = \text{the}\}\$$

- Plot the proportions  $n_{\text{word}}[i]/i$  over the document in one plot.
- Find an envelope of the shape  $O(1/\sqrt{i})$  for each of these five words.
- Why can we **not** apply the Central Limit Theorem directly?
- How would we have to change the text for it to apply?
- · Why does it still work quite well?

```
In [209]: import string
          import numpy as np
          from matplotlib import pyplot as plt
          filename = gluon.utils.download('https://www.gutenberg.org/files/84/84-
          0.txt')
          with open(filename) as f:
              book = f.read()
          for c in string.punctuation:
              book = book.replace(c,"")
          book = book.lower() ##convert all to lowercase
          book = book.split()
          words = len(book)
          counts = [0,0,0,0,0]
          for k in range(5):
              counts[k] = nd.zeros(words).asnumpy()
          for i in range(words):
              if book[i] == "a":
                   counts[0][i] = 1
                   continue
              if book[i] == "and":
                  counts[1][i] = 1
                   continue
              if book[i] == "the":
                  counts[2][i] = 1
                   continue
              if book[i] == "i":
                  counts[3][i] = 1
                   continue
              if book[i] == "is":
                  counts[4][i] = 1
                   continue
          var = 0.15
          x = np.arange(1, words+1)
          for k in range(5):
              counts[k] = np.cumsum(counts[k])/x
              counts[k].reshape(words, 1)
          plt.figure(figsize=(20, 10))
          for k in range(5):
              plt.semilogx(x, counts[k])
              mean = counts[k][words - 1]
              plt.semilogx(x, var*np.power(x,-0.5) + mean, "r")
          plt.show()
```

Q: Why can we not apply the Central Limit Theorem directly?

A: CLT asks for a normalized sum of sufficiently many i.i.d random variables, but in this text, the words don't appear independently from each other. Take "the" for example: whether "the" appears at one position is not independent from the ones near it (a "the the" phrase might never appear).

Q: How would we have to change the text for it to apply?

A: Following up on the answer above, we can re-shuffle all the words in the text to make each word distribute more evenly, to reach the desired independance.

Q: Why does it still work quite well?

A: Because the proportions are very small in mean and variance, and as the total number of words increse, the correlation between words tend to be trivial.

### 3. Denominator-layout notation

We used the numerator-layout notation for matrix calculus in class, now let's examine the denominator-layout notation.

Given  $x, y \in \mathbb{R}$ ,  $\mathbf{x} \in \mathbb{R}^n$  and  $\mathbf{y} \in \mathbb{R}^m$ , we have

$$\frac{\partial y}{\partial \mathbf{x}} = \begin{bmatrix} \frac{\partial y}{\partial x_1} \\ \frac{\partial y}{\partial x_2} \\ \vdots \\ \frac{\partial y}{\partial x_n} \end{bmatrix}, \quad \frac{\partial \mathbf{y}}{\partial x} = \begin{bmatrix} \frac{\partial y_1}{\partial x}, \frac{\partial y_2}{\partial x}, \dots, \frac{\partial y_m}{\partial x} \end{bmatrix}$$

and

$$\frac{\partial \mathbf{y}}{\partial \mathbf{x}} = \begin{bmatrix} \frac{\partial \mathbf{y}}{\partial x_1} \\ \frac{\partial \mathbf{y}}{\partial x_2} \\ \vdots \\ \frac{\partial \mathbf{y}}{\partial x_3} \end{bmatrix} = \begin{bmatrix} \frac{\partial y_1}{\partial x_1}, \frac{\partial y_2}{\partial x_1}, \dots, \frac{\partial y_m}{\partial x_1} \\ \frac{\partial y_1}{\partial x_2}, \frac{\partial y_2}{\partial x_2}, \dots, \frac{\partial y_m}{\partial x_2} \\ \vdots \\ \frac{\partial y_1}{\partial x_n}, \frac{\partial y_2}{\partial x_n}, \dots, \frac{\partial y_m}{\partial x_n} \end{bmatrix}$$

Questions:

1. Assume  $\mathbf{y} = f(\mathbf{u})$  and  $\mathbf{u} = g(\mathbf{x})$ , write down the chain rule for  $\frac{\partial \mathbf{y}}{\partial \mathbf{x}}$ 

A: for the jith entry in the resulting matrix:

$$\frac{\partial(y_i)}{\partial(x_j)} = \frac{\partial(y_i)}{\partial(u_i)} * \frac{\partial(g_j)}{\partial(x_j)}$$

1. Given  $\mathbf{X} \in \mathbb{R}^{m \times n}$ ,  $\mathbf{w} \in \mathbb{R}^n$ ,  $\mathbf{y} \in \mathbb{R}^m$ , assume  $z = \|\mathbf{X}\mathbf{w} - \mathbf{y}\|^2$ , compute  $\frac{\partial z}{\partial \mathbf{w}}$ .

Write out expression for z with entries in X, W, y:

$$z = (\sum_{i=1}^{n} x_{1i} w_i - y_1)^2 + \dots + (\sum_{i=1}^{n} x_{mi} w_i - y_1)^2$$

$$\frac{\partial z}{\partial w_1} = 2(\sum_{i=1}^{n} x_{1i} w_1 - y_1)(x_{11}) + \dots + 2(\sum_{i=1}^{n} x_{mi} w_i - y_1)(x_{m1})$$

Thus for  $k = 1, \dots n$ 

$$\frac{\partial z}{\partial w_k} = 2(\sum_{i=1}^n x_{1i} w_1 - y_1)(x_{1k}) + \dots + 2(\sum_{i=1}^n x_{mi} w_i - y_1)(x_{mk})$$

#### 4. Numerical Precision

Given scalars x and y, implement the following  $log_exp$  function such that it returns a numerically stable version of

$$-\log\left(\frac{e^x}{e^x+e^y}\right)$$

```
In [210]: from math import exp, log
    def log_exp(x, y):
        ## add your solution here
        first = nd.exp(x)+ nd.exp(y)
        first = nd.log(first)
        return first - x
```

Test your codes with normal inputs:

Now implement a function to compute  $\partial z/\partial x$  and  $\partial z/\partial y$  with autograd

```
In [212]: def grad(forward_func, x, y):
    ## Add your codes here
    x.attach_grad()
    with autograd.record():
        z = forward_func(x, y)
    z.backward()
    print('x.grad =', x.grad)
    y.attach_grad()
    with autograd.record():
        z = forward_func(x, y)
    z.backward()
    print('y.grad =', y.grad)
```

Test your codes, it should print the results nicely.

```
In [213]: grad(log_exp, x, y)

x.grad =
    [-0.7310586]
    <NDArray 1 @cpu(0)>
    y.grad =
    [0.7310586]
    <NDArray 1 @cpu(0)>
```

But now let's try some "hard" inputs

Does your code return correct results? If not, try to understand the reason. (Hint, evaluate exp(100)). Now develop a new function stable\_log\_exp that is identical to log\_exp in math, but returns a more numerical stable result.
